Backend Coverage Report

Imported JaCoCo measurements; backend CI is the threshold authority

Provenance

Test branch: feature/TEST-042-final-testing-deliverables; test repository SHA: 738db9d.

TEST-042 backend CI run: 40180383416; backend source SHA: 8cb633c2c12868cb3239a8940e24cad1abd42746; conclusion: success.

Backend workflow run: 40180383416; backend source SHA: 8cb633c2c12868cb3239a8940e24cad1abd42746.

Measured coverage

No JaCoCo XML was imported into this test-repository run. The latest separately recorded backend CI aggregate is run 40172276922 at backend SHA 40deaa168180365c3f9370aefcffe92471c58c26: 12 unit modules, 53.28% line, 33.73% branch, and 50.55% instruction coverage.

Guideline comparison

The guideline requires at least 80% line and branch coverage for new code, 100% API endpoint integration-test coverage, and 90% branch coverage for critical business logic (SENG 34213 System Development Project Guideline, section 6.4).

The current TEST-042 backend unit/coverage workflow completed successfully, including the assignment-service unit job and JaCoCo artifact. Its aggregate values, when shown above, remain a separate measurement and are not changed-code coverage. The per-class 90% branch gate covers QuizGradingServiceImpl and GradingServiceImpl, mapped to SDS sections 4.5 and 4.6. Local full assignment-service verify also passed: 95 tests, zero failures/errors/skips; Quiz reached 35/35 lines and 14/14 branches, and Assignment reached 68/68 lines and 38/38 branches.

No integration JaCoCo report is attached to this evidence. The route matrix links source-level requests/assertions; it does not establish that every effective API endpoint passed an integration test. The 80% changed-code line/branch requirement also still needs CI evidence.
